Esperienze sullo sviluppo della forza provenienti da altre discipline sportive

Lorenzo Pugliese, PhD

19/06/2020

Un cambio di paradigma

Le priorità

**Indicazioni
metodologiche e
misure quantificabili
(intensità, volume, ecc)**

Molta letteratura di
riferimento

**Indicazioni sulla
qualità del movimento
(tecnica, posizione,
ottimizzazione del
movimento)**

Meno informazioni
presenti

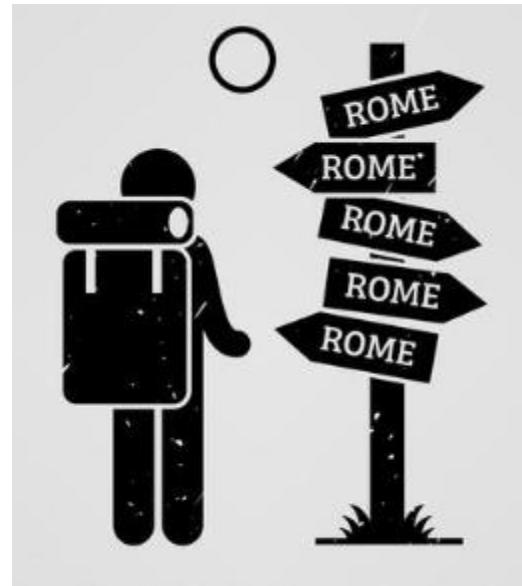

Le priorità

QUALITÀ vs QUANTITÀ

Le priorità

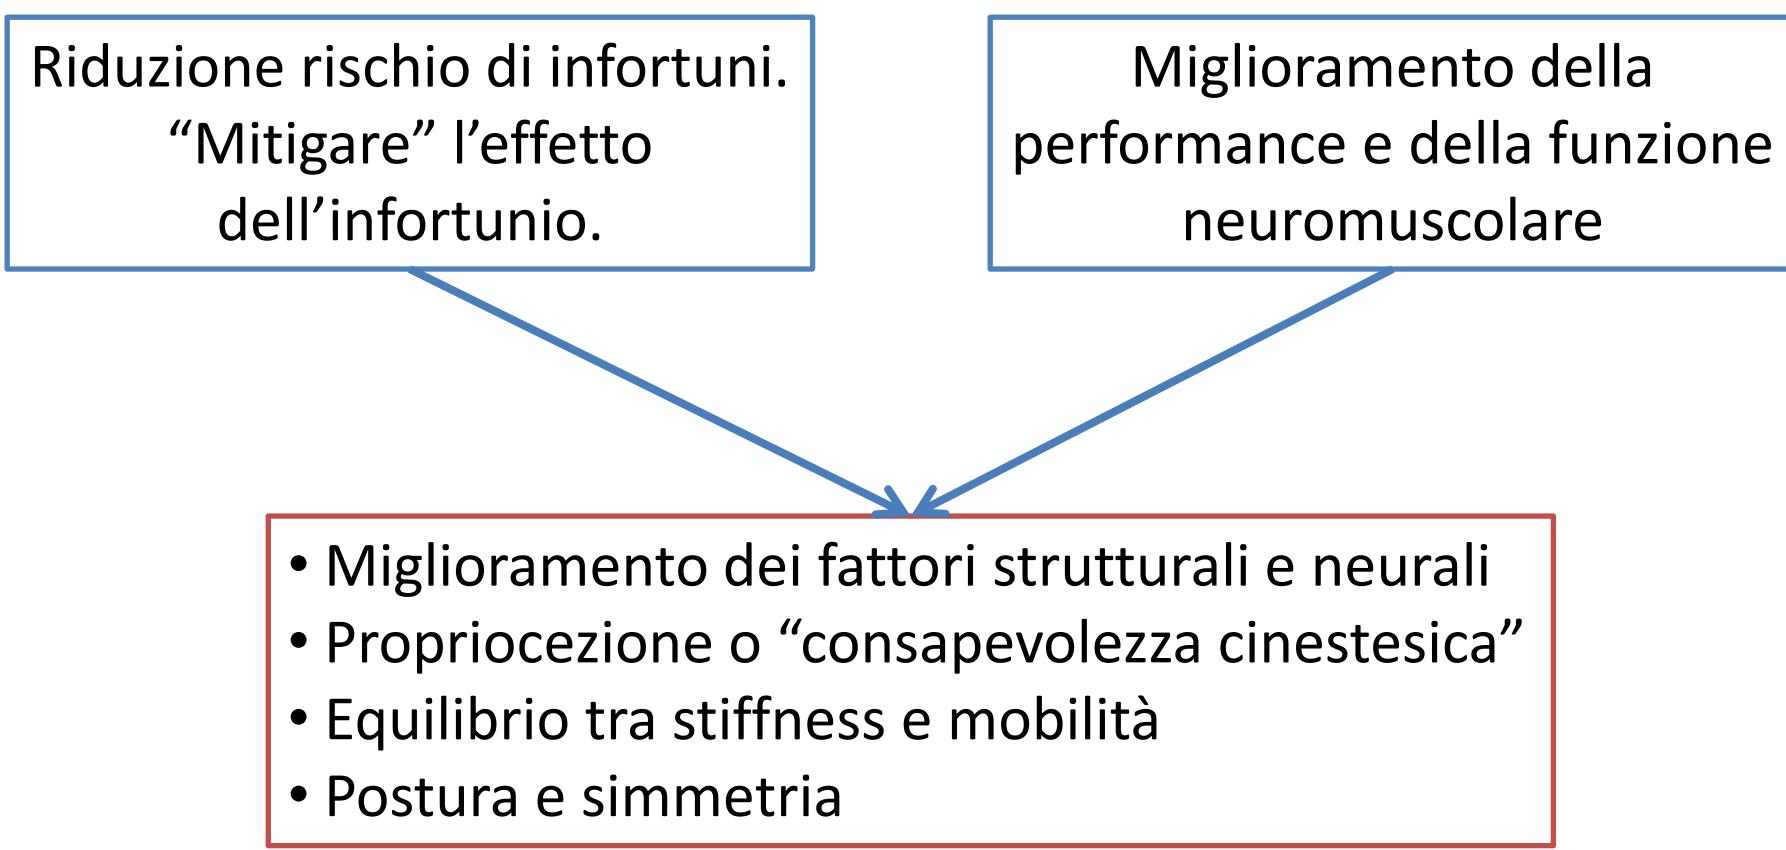

MOVIMENTO vs ESERCIZIO

Gli obiettivi

Riduzione rischio di infortuni.
“Mitigare” l’effetto
dell’infortunio.

Miglioramento della
performance e della funzione
neuromuscolare

- 
- Miglioramento dei fattori strutturali e neurali
 - Proprioceuzione o “consapevolezza cinestesica”
 - Equilibrio tra stiffness e mobilità
 - Postura e simmetria

Aspetti da considerare

- Relazione tensione-lunghezza
- Feedback propriocettivo
- Plasticità neuromuscolare
- Co-attivazione e stiffness
- Range of motion (ROM)
- Fatica

Un approccio pratico:

- **Obiettivo:** proporre una metodologia di lavoro con i sovraccarichi che massimizzi la funzione muscolare e la sicurezza.

Un approccio pratico:

- Fase eccentrica dell'esercizio viene eseguita deliberatamente in modo lento e controllato e dura, generalmente, tra i 3 e i 5 secondi.
- La fine della fase eccentrica è seguita immediatamente da una pausa isometrica nella posizione di allungamento questa dura dai 2 ai 7 secondi. Il punto di stop è generalmente intorno ai 90 gradi articolari o nella posizione parallela.
- Il movimento viene infine concluso con una fase concentrica molto esplosiva
